The value I'm passing in is a list of strings; if I just type: pd.read_csv('index_{indices}',headers=True) it'll work fine. But the data I'm working with often doesn't include whitespace, so I'd like to be able to use something like: pd.read_csv('index_{indices.format(sep=" ")}',header=True) ...but that doesn't work. I'm currently using something like: indices = ["0","2","1"] pd.read_csv('index_{indices[1]}',headers=True) ...but if there's a more pandas-y way, I'd love to know. A: You could use join to join together the table with the comma, or a space for a space. f'index_{indices.join(",")} ,header=True' Q: How to turn a raw pointer into a QList? Given a raw a1d647c40b

Simplify even the most complex drawings by using the built-in AutoCAD Drawing Correction engine, which enables you to easily remove complex linework. It allows you to mark up your drawings for easy and intuitive corrections, or create and execute CAD standards that automatically apply to entire designs. (video: 1:48 min.) Simplify your designs with a more intelligent Context Switching, which allows you to change your settings without interrupting the current command. For example, you can change your rendering preferences from Flash to Screen for a 2D image, and return to Flash for 3D. It automatically switches between the current command, not just to the next command, but to a new command. It's a huge timesaver. (video: 2:16 min.) Extend existing commands to be more intuitive and easier to use. With a new Attach Operation, you can attach new parts to your drawing and update them automatically when your drawing is updated. It also supports soft lines, for easy tracking, and annotations with a new Attach Operation. Enhance your drawings by adding more control over placement, you can now easily direct groups of objects to specific vertical and horizontal locations on the canvas. Choose which position you want each object to be placed, or let the system find the best fit. This allows you to create paths that don't require tracing. Paths can be created by straight lines, curved lines, extruded edges, outlines of objects, or closed loops. They can also be inserted into existing paths or created from an existing path. (video: 3:08 min.) You can now
