Programming interfaces for AutoCAD are covered in the.NET Developer Center, AutoLISP manual, and Visual LISP manual. AutoLISP and Visual LISP support the creation of AutoCAD plugins, which are often used to create functions, macros and add-ons. AutoCAD also supports the ObjectARX SDK and the Sysclass project. The legacy AutoLISP API (based on AutoLISP V2) can be used by Visual LISP and AutoLISP developers. There are tutorials and example code for this in the reference manual. VBA and.NET VBA was created as a Visual Basic scripting language to automate desktop applications. It provides functions to create macros, scripts, and add-ons. VBA has been Microsoft's scripting language of choice since AutoCAD 2000. The use of VBA has declined in recent years. .NET was designed by Microsoft for running Windows and Microsoft Office applications on other platforms. Its capability was developed as a replacement for COM and script languages such as AutoLISP and Visual LISP..NET was first released in 2000. An add-in product that provides access to AutoCAD from the.NET environment is AutoCAD Architect. It was a stand-alone add-in product from the time it was first released until AutoCAD X. AutoCAD Architect's development was later integrated into the Architect X and 365 architecture products. AutoCAD's.NET API is also used by the AutoCAD Platform SDK, a set of.NET classes and interfaces used by developers creating AutoCAD add-on products. AutoCAD Architect uses the Platform SDK. Add-on products The popularity of AutoCAD over the years has been attributed to its capability of supporting a wide variety of applications. One such application is Autodesk Exchange Apps, a set of AutoCAD add-on products, including the following: AutoCAD ArcGIS, which maps with ArcGIS. AutoCAD Compute, for virtual 3D environments. AutoCAD Electrical, a 3D analysis and design software product. AutoCAD Landmark, a 2D annotation and integration product. AutoCAD Match, for asset management, modeling and viewing data. AutoCAD Match 360, a content-aware matching and coordination product. AutoCAD Mechanical, for structural and mechanical engineering. AutoCAD a1d647c40b

I was using Arch, and had a problem with my audio card, so I had to reconfigure it to use PulseAudio and PULSE instead of Alsa. I can't get audio to work on either Arch or Ubuntu. I am wondering how I can get pulseaudio to not use the pwm channel to drive the audio output. I tried using pavucontrol to see the settings, but it doesn't show any of the pwm settings. A: While it is somewhat of a hack, you can remove the pwm from the PulseAudio configuration for that particular device. The command is sudo alsactl --device=hw:1,3 disable Or, for the hardware device at the PCI bus, sudo alsactl --device=hw:0,3 disable Q: Invalid range in Adobe Media Server I am trying to use Adobe Media Server to stream audio and video to a flash client. I have used the "Generate" option in the OMXPlayer component in order to create the MPEG file. The file is received at the server, but I get an error in the console that the dimensions of the range specified in the transport packets are incorrect. For example, an image of 1920x1088 pixels is divided into three packets: 1920/4=460, then 1088/4=235 and finally 4/2=2. I do not know the reason for the invalid range, but I have verified the values are correct. Any ideas? Thanks, Dan A: Based on the error you described (using AAC) and looking at the OMXSampleRateNumericCodec class, it seems that the following ranges are supported: [250, 950) [460, 1080) [920, 1920)
