The first 2D drafting application After purchasing a Macintosh from Danew, a programmer working for Apple, in 1981, Autodesk began developing AutoCAD, the world's first 2D drafting program for personal computers. At the time of its introduction, AutoCAD was a four-year development project, costing more than \$1 million. At first, the goal of AutoCAD was to allow drafting of objects with the stylus (pen) on a tablet using bitmap graphics. An example would be to draw a house on the screen by selecting the letter X and the words Make a house (House) by entering letters using the stylus. However, this was seen as too confusing for most users. Ultimately, the company decided that the best approach was to create a simple program that would enable the user to create drawings by "pressing keys." Autodesk was founded in 1982 by Alvy Ray Smith, an engineer from AutoMate, Inc., and his wife, Trudy, both of whom had worked on AutoCAD and were highly experienced in computer drafting. In 1983, a version of AutoCAD was released that could be used for free on a computer with an internal graphics device. With this version, the user was able to "draw" by pressing keys on the keyboard instead of using the pen on the tablet. In 1985, AutoCAD released CAD, version 1.0, which allowed the user to work with 3D objects. Because of the limited technology of the time, the application had a very limited feature set and users could only view 3D objects in wire frame (2D), without the ability to rotate or zoom them. With version 2.0, released in 1987, AutoCAD was extended to include support for file and data exchange, image creation, and object transformation. The next version, released in 1989, introduced isometric views, the ability to scale and rotate objects, and improved toolbars and menus. The following year, a "shape" tool was added to allow the user to draw objects using a geometric shape rather than the traditional "line" tool. In 1992, AutoCAD was bundled with Microsoft Windows and was priced at \$2,000. In 1993, AutoCAD was released as a stand-alone version, making it easier to transfer data between work files in different computers. With AutoCAD 3D, version 1.5, the software introduced the ability to work with 3

as means of communication between third party applications or to create custom viewers. Java API The ObjectARX library is based on the Open Object ARX project, a project created by Autodesk. ObjectARX provides the C++ class library and application programming interface (API) for applications to write extensions for AutoCAD. AutoCAD XML files are text files with the XML format. This allows the exchange of information between AutoCAD and other applications. AutoCAD XML is similar to the standard markup language XMI, which is used in ObjectARX. AutoCAD XML files are also supported in the AutoCAD Exchange Add-in and used by the Autodesk Exchange Apps for Android. Visual LISP Visual LISP is a scripting language created by Autodesk that can be used in AutoCAD. Visual LISP functions are executed by means of standard commands. This allows Visual LISP to achieve a high degree of automation. Visual LISP has been superseded by AutoLISP and VBA. To strengthen the existing National Stepping Up to Cancer program (NSUC), improve the extent of the program, and provide research and evaluation support for all activities, the National Institutes of Health (NIH) intends to develop a Comprehensive Cancer Control Network (CCCN) grant. The NIH plans to create a cancer control research agenda, train a cadre of cancer control researchers, and evaluate the NSUC. The NIH will support the CCCN through the National Cancer Institute (NCI), with an emphasis on the following functions: (1) supporting the NSUC through grants to community-based organizations and other nongovernmental organizations (NGOs), (2) providing technical assistance to NGOs, (3) providing training and dissemination of information and program development, (4) supporting the CCCN community advisory board (CAB), and (5) serving as a repository of CCCN activities and results. The NSUC grant will support a comprehensive system of cancer control in a way that allows for the integration of cancer control activities in a coordinated, multi-faceted effort. National efforts are directed at national planning, development of state and local programs, institutional and community capacity building, and evaluation of the system. In addition to NSUC, NCI's cancer control activities are enhanced through other grants, such as the Breast Cancer Screening, Demonstration and Evaluation Project (BCSDP), which is managed in collaboration with NIH. BCSDP aims to demonstrate the cost-effectiveness of different models of organized breast cancer screening and to evaluate these models in a large, multi-state, clinical trial. BCSDP is designed to evaluate the program and policy effects of these models through the state and local use of the trial results, and to obtain detailed information on the organization, financing, and outcomes of screening programs. In addition to the roles of the NSUC and the BCSDP, the National Cancer Program (NCP) supports a number of other cancer control activities, including an effort to monitor the efficacy of mammography screening, an observational study of the use of HMOs in cervical cancer screening, and a cancer registry. In addition, NCI supports cancer control activities through research grants and cooperative agreements that allow for the development of new research initiatives,

Directly define a line with a type-based annotation. The type-based annotation can be directly edited with the cursor, and converts back to a line when exporting to DWG. (video: 6:18 min.) Trace directly: Add trace lines, arrows, and text by just clicking with the trace tool, without additional drawing steps. (video: 5:54 min.) 3D Drawings: Convert 3D Models to AutoCAD. Add dynamic analysis to 3D models in Autodesk Design Review, Forge, and Fusion 360. (video: 1:24 min.) 3D Printing: Use existing 3D assets to instantly see a CAD model appear on a 3D-printing machine. Then, 3D-print any part on the fly. For example, you can use an Autodesk Design Review Model to 3D-print a rough CAD model into a solid part. (video: 9:20 min.) Make your markups shareable. Your markups are associated with a page in Design Review or Fusion 360, making it easy to access and share them. (video: 7:55 min.)
