The primary purpose of this program is to generate color schemes from a master color image. You can define a master color using the first or third screen by selecting the color you want. You can also define a color using the hue, saturation and lightness of a color given in the second screen. When a color picker launches, it shows the master color on the first screen and then shows the three hues and three saturation, all those values. The three lightness values are in the next three channels. You can highlight the hue you want by clicking. If you select the same hue in both the first and third screen, the color picker displays the saturation and lightness of that color on the second screen. You can highlight those values in the same way. When you have selected all the hues on the second screen, you can copy the saturation and lightness to the first screen by clicking on the button with the three arrows on it. The color picker shows a preview of each color of the selected hue on the second screen. You can see it on the left and right side of the screen (e.g., you see the left side of the color of the hue you are selecting with the yellow square). After you select a color, the color picker immediately closes. You can make color suggestions by clicking on the suggestion button. You can get color suggestions by clicking the suggestion button. You can save the picked colors to a file with the color picker. You can click the save button. Color palette is saved as a.sls file. You can open it with the color picker. If it is saved on your computer, you can open it directly in your web browser without the need for the program.
