That means that Sam, an adult Samasati Swati, will now appear on the city's website, providing residents with information about what he can and cannot do around his rental home. The city's protection order database allows residents to request a protection order if they feel they may be in danger. Anyone may request a protection order, and if they do, the city will request a judge to issue an order making the other person keep to

OOB and variable scoping in Perl 6 While all procedural languages have similar variable scoping rules, some (like Perl 5) make variables have different lives depending on their position in the code, and others (like Python and Ruby) make variables only live within a function. In both Perl 5 and Perl 6, I've found that when setting the variable inside the code block of a for loop and then in the loop body, the variable that was set inside the loop still displays the original value. If I set the

variable outside of the loop body, it doesn't display the original value anymore. I've used the following example program to show this: `#!/usr/bin/perl6 my \ $my_int = 0; for \ $my_int \ $i { print "$i ";`
