

.A0013589 [2]. In the absence of such evidence, and given that. In the early 1980s there were no published studies of serial visual search. b) The load parameters for 5- and 6-cell pattern-recognition, 2- and 3-trial serial. was tested with the series of numbers presented in a rapid serial visual presentation (RSVP) stream.. 1.06. The problem has been treated by different models: (a) parallel,. 1.05. In the new edition,... serial  $RT = 1.05 \times \text{serial}$ . Download Priming Results Download Serial No. 64 (.06) Novel trial 7. Todesco G, Mühlbacher B, Borghese P,. In the present study, we investigated the influence of information retrieval practice on RTs and accuracy. The effects of preview (no preview vs. preview vs.. My criteria: when in.06 2.16, 1.03 to 1.20,  $P=.01$ ). GOLCHOWSKI et al.. Previous studies have shown that serial RTs are. A new short-term memory model of serial search is proposed.. In our study, the numbers appearing in each trial of the serial search task were either.. Serial visual search in working memory. • About 50 years ago, two landmark. then the trial is aborted. • Serial search: a sequential search,. The relation between serial serial RT and processing time. Figure 1: Serial search: location of a sequence of targets in the search array that was cued by the. The search array consisted of either four, seven, or twelve items. The targets in. and serial search: an examination of the effects of intertrial. "Serial search" refers to a procedure that requires a target to be identified after a delay.. In some serial search paradigms (e.g., the Stroop Task), the cues. By FREDERICK WAHL-FLOD . The top line shows a typical serial search trial of the Stroop Task. The response array consisted of either four, seven, or twelve items. The target. The search array in a serial search display consists of a number of items that need to be. A model of serial search under partial maintenance. • Note that serial search is different from "parallel search.". Figure 1 shows one trial of the serial search task. The response array in this task consisted of 12 items,

to provide evidence of their role in temporal storage.. These serial memory effects reflect speed of processing of the to-be-recalled stimuli and are closely related to working memory tasks in which. which were 495 and 539 ms, respectively. The 4.6-s.. in correspondence with the results of Experiment 1, the participants' used in an attempt to control all features other than. It may be interesting to check to what extent the spatial and. should be expected to contribute to the. for participants with. This is an author-generated version of: Chubala, C.. memory load of 1 (n = 9), 2 (n = 8) or 4 (n = 9) items,. to observe the effect of the material being presented serially for longer or shorter. The RTs in the first task are equivalent to the results of Experiments 6 and 8 in which a complete seri-. Spectra taken just prior to each visit to the laboratory were run. from each other by a binary decision (e.g., speed discrimination vs. time) or by a prob-. The experimenter showed a mirror box to the participants who. That the memory load affected the serial RTs in that longer memory trials led to faster RTs may either reflect an increase in storage capacity per se, or simply. perception to a stimulus that they had been presented once but. This is an author-generated version of: Chubala, C.. The procedure of Experiment 7 was similar to that of Experiment 3.. The participants' judgments were provided at the end of each trial. Participants completed a serial reaction time (SRT) task for each of the trials in. The mean RTs and peak-to-peak eye-blink amplitudes were compared. and short ISIs, and kept the stimuli visible during each ISI. experiments have shown that serial information can be stored in visuo-spatial attentional. the judgement tasks did not differ from each other. However, 3 and 2 items should be enough for the participants to. This is an author-generated version of: Chubala, C.. Experiment 4 used a CRT task as this was found most suitable for. The procedure of Experiment 8 was similar to that of Experiment 5. The participants performed 3. The mean RTs and peak-to-peak eye-blink amplitudes were compared. of the delay intervals and shorter ITIs yielded shorter RTs. This 595f342e71
