For anyone thinking about getting into CNC programming, or upgrading their existing CAM software, I can't recommend any other program that CAMWorks. It just works. Yet, even with its "Pleasant Wrap-Up," this program comes to a very reasonable price point. I'd say this is one of the most popular programs among my users and you shouldn't be stuck without it. When you first run this software, you will find it is setup with the most common tools and spindle types. It will ask to set the default tool diameter, select your tools, and provide a tool path for the default spindle setup. You will also be prompted to pick from a number of spindle lengths and speeds. However, this step is optional. You are not required to set any of this information. You will just be prompted to choose it later if you like. Most people think that the software makes the machine but really it is the machine that makes the software work. So although you will be using the software to program the machine, you are ultimately using the machine to build your products and then the software to verify the results. Software is a major component of a CNC machine. After your machine is set up, the software is then used to program the machine. You have choices, some being CAD free, some requiring a CAD program, and others using mastercam. You will see that CAD CAM Software is a CAM program. Its all about planning your work, programming the CNC machine, and then tooling up. That's the whole idea. You can not build with the CNC Machine if you do not have the CAM software. The CAM software is what gives you the ability to do all of the above. Without a CAM software, you will be limited to using a different method to build your products. Computer Aided Design is a great way to plan a product and is a great way to develop a product. But to get that product to machine you need to use CAD CAM software to convert those ideas into reality.

The kcam_gui file is a graphical application used to launch the kcam software. You can download this file from our website, and you can use it directly as a standalone. If you do not have any configuration file, you can launch the software from the kcam_gui GUI. Kcam does not generate files automatically on its own. It is very important to specify the destination for the file to be created. For the file it creates, it does not automatically generate a header file. The majority of this software should be used for prototyping and CAD simulations. The application of this software is a personal preference. Some applications are better for some tasks than others. Most CAM software should do all of the following: Design and simulate geometric operations. Allow the user to export as DXF Allow the user to load and export a DXF file. When you are ready to move to the next phase of design, moving from CAM prototyping to CAM production, you will want

to move your files to another software suite. This step can be done with many different CAM software programs, but the main CAD software programs are: DesignCAD EAGLE SketchUp SolidWorks While not all of the open source GEDA CAM software suites are free, some are like gEDA very economical. DesignCAD and EAGLE are very popular. The software is typically used for CAM simulations and should be used for on-screen graphics. Simbiology is another CAM package popular with industrial design and manufacturing students that is a half price coupon.
