Everybody's heard the phrase "power seeing," but now there's an app for that. For those less confident with their digital photography or video skills, "Sight," a $9.99 app from Adobe that automatically detects and corrects facial expressions for group photos and videos, might be just the thing. Developers say the app can identify "microexpressions" that reveal a person's true emotions, including excitement, surprise, sadness, fear, contentment as well as anger and disgust. The app blurs out moving objects and masked portions of an image to leave only the face clearly visible. The app works in real time, telling users whether the app has detected a facial expression. "Sight" scans up to 50 images and 1 minute of video in one session. It has four settings: for "Basic" is a $4.99 extra charge for "detailed" and "extreme settings" are $9.99 and $19.99, respectively. At the moment, the app is also exclusive to Android devices. Everybody's heard the phrase "power seeing," but now there's an app for that. A lot of things about the editing and image editing tools and their features are available in other versions of Photoshop, but that doesn't make Photoshop any less valuable. Photoshop works really fast, so even if you don't want to learn all the features, you will still be able to cut photos in a few minutes. It is also useful in video editing and you can use one version of Photoshop or CC at the same time. Color correction is one of the best features, and it can eliminate the mistakes of your clients or work more professionally. The straightening tools are very useful and you can use it to remove those man-made stuff from the photo. Best of all, Photoshop has a good preview feature which helps you in getting the best quality of the graphic design from the beginning. It can work with any size of photo, and you can always work in the size according to your project. Photoshop's Content-Aware Move feature is a super clever feature, allowing Photoshop to use the content of your images and the surrounding area to blend perfectly into the background. In other words, Photoshop will try to "move" the object seamlessly from a position on the original image, into the new area of the copied image. This is tremendously helpful when working on a picture where the original is missing or blurred by a moving subject. Content-Aware Move is really cool. You can use it to replace "lost" parts of backgrounds, bodies, hair or clothing, hiding imperfections. You can also create a process entirely from scratch to create stunning composites. Simply select the area you want to include, and then press the Create Composite button to automatically create a perfect blend of the selected area and the rest of the image.
