I'm impressed by what Adobe is finally doing with Lightroom and Photoshop. While I felt that the biggest problem with Lightroom 5 was that it didn't support Fujifilm X Pro T (and Fuji X) or the new X Trans RAW format, Adobe has made some huge strides to integrate the X Sensor RAW recorders into Lightroom. Lightroom CC now has all of the options that were missing from the previous releases, including the ability to manipulate the RAW records themselves. The X Gold & Platinum are now supported. Additionally, Adobe has effectively eliminated any sort of environmental noise on the files that were affected by the phase-one X-Trans RAW files, something that was sorely lacking in the previous versions of Lightroom. Photoshop is one of the world's best and most popular photo- and image-editing software. This product boasts powerful editing tools that make it the choice of professionals everywhere. A few annoyances remain but, overall, the RAW conversion feature in Photoshop is very coherent, stable and mature. While I'm not a professional photographer, I quickly fell in love with this program. Easy to understand, accurate previews of RAW footage, strong and algorithmic workflow, and very good performance - of course, the latter is often negatively affected when a long-lasting project is doing its job. And even when I got over the feeling that the program offered too little in terms of tools, it became obvious that it still has a lot to offer. Of course, it has a disadvantage at the moment, in contrast to the situation with the film. You can only see a medium-sized picture in 8/11 times the size of a medium transparency, depending on the orientation.
