What sets Photoshop apart from other apps these days is its AI transformation. Photoshop uses AI to automatically re-color images without human intervention. Algorithms can make powerful adjustments and you can use this power to fine-tune the colors. I kind of wish Photoshop had some slider control to fine-tune the adjustment. Sometimes the sliders just don't provide the nuance needed. For example, sometimes you don't need to make an image a bit over saturated, either. Instead, you just want to significantly ramp up the saturation without overdoing it. In some cases a fixed level for similar colors is all that's needed. For instance, you won't want to make colors any more saturated than they were originally. When it comes to particular use cases, I'd suggest checking out the features, adjusting things to taste. This is how professional photogs approach their jobs, too. The trouble is, these features are not beginner friendly. If you spend time playing with the tools, it'll be a lot more valuable. A cool new feature includes the ability to trim images evenly or along a path and then layer masks on top of the image. This is a really powerful feature that gives you the ability to create a layer mask that contains any portion of the image. The problem is that you get a masked perspective version that's invisible. You can't delete an area of the photo because of it. When it comes to photo editing software, Lightroom is a perennial top-of-the-line contender that does substantially better for photographers than it does for professionals. I've been using Lightroom since Version 4.1, and I've always been pleased with what it did for my images, though there were missing features through the years. Version 5.0 certainly will help solve some of the missing issues. A more professional image editing application is Adobe's Photoshop, and it's the program of choice for most designers, architects, and other creative pros. I like Photoshop's smooth, constant stream of upgrades, and it has expanded its features in an ongoing effort to keep up with every technological advance. But some may find it counter-productive to have to learn yet another application for digital imaging. The adage "You get what you pay for" still applies in the world of image editing, so if you're willing to spend for a topnotch package, there are lots of image editing alternatives.

The key feature that makes Photoshop and the rest of Adobe's Creative Suite so great is the way that they work together. When it comes to an individual piece of software, Photoshop is really the pinnacle of image editing. They've created really great effects and filters, and they better than anyone making the sorts of edits that we get in Photoshop. What Photoshop is great at, though, is the integration between apps. Photoshop does great for digital photo editing, but that doesn't really mean much if we're relying on the programs that it works with – like the rest of the Creative Suite – to do the work. So Photoshop's strength lets the rest shine, and they, in turn, give Photoshop the tools to do the heavy lifting. Before you think, "Lightroom will save me time and trouble!" you might want to consider the facts. Photoshop is more than capable of doing anything that Lightroom can. The main difference is that Photoshop is an all-encompassing program – you can do everything you need with it. Lightroom's a great tool, but it's not Photoshop. Not by a long shot. I mentioned Lightroom in my review of the camera, but I must stress that Lightroom is quite nice. Adobe Photoshop is available for Windows and Mac operating systems.
